CREATIVITY, CULTURE & THE CITY: A QUESTION OF INTERCONNECTION
There is a need to switch the question: Not what is the value of imagination creativity, culture, heritage, the arts or design for city development. Instead, what is the cost of not thinking of imagination, creativity, culture, design, art and heritage? Name a city that is globally important, but weak in these spheres. All cities need to gain recognition and to get onto the global radar screen in order to increase their wealth creation prospects, to harness their potential and to keep their best talents and attract interesting new people. Creativity, the cultural distinctiveness of place, the arts and a vibrant creative economy are seen as resources and assets in this process. ‘Creativity’ whose essence is a multifaceted resourcefulness is a primary asset since human cleverness, desires, motivations and imagination are replacing location, natural resources and market access as key urban resources. Creativity is legitimised within the arts and should spread to other spheres from encouraging social innovations or establishing more creative bureaucracies.

Most cities are in transition, especially those with an industrial past, and need to renew and revitalize their economic base in order to move up the value chain and to become more knowledge intensive places. To keep and attract the increasingly mobile workforce the attractiveness and vibrancy of place and the opportunities it provides matters as never before. The atmosphere, look and feel of places are strongly shaped by the arts and cultural institutions, who contribute significantly to generating interest and vitality. Mostly the focus has so far been on city centres, in the next phase of urban development suburban creativity and culture will be one of the major priorities.

Too many cities are developed within a limited, hardware focussed technically driven urban engineering paradigm as distinct from creative city making which combines hardware and software perspectives, which also focus on the sensory and experiential and seek to create the conditions for exchange, transaction and networking. Retrofitting the conditions for conviviality and rediscovering the power of the public realm is increasingly important. Culturally literate good urban design helps this process. The creative commons characterised by openness. The ‘creative commons’ focused on sharing digital creativity is a similar expression of the same idea – one is physical and the other virtual.

City renewal at its core is a cultural project as it involves not only economic and physical transformation, but also a shift in mindset and perspective. To bring people with you cities need to engage them in their renewal story. Cities on the move need a compelling story to drive motivation and commitment and the artistically trained people are particularly good at storytelling. The best cultural policies combine a focus on enlightenment, empowerment, entertainment, employability and creating economic impact. Our view of cities is a mix of reality and truth, hype and perception usually filtered through media representations. The overall culture of a place and the arts help define and shape identity, perception and image within the city’s own terms. The drive to create rich sensory environments in cities provides new opportunities for those working in the creative professions. Equally as the marketing proportion of a product’s sale value increases the scope of work for these professions rises.

The creative economy sectors, music, the new media, design, performance and literary expression are an increasingly important sector within urban economies. A vast array of evidence documents this fact and their contribution to employment and income for urban economies. In addition they have softer indirect spin-offs for cities, such as encouraging tourism or their vitality or shaping identity. Some qualities differentiate the creative industries from other fields because like the arts they often deal with the sensory realm and help create experiences. Crucially these sectors contribute not just to adding economic value and jobs, but more importantly, to the evolutionary process of the economy and society as a whole. Behind music lies sound and vibration; behind the painting an art than a science, but strong principles can help cities on their own terms. An underexplored insight is that these attributes have migrated into every sphere of life and every industry and service. This makes their combined impact as powerful as electricity. The current economy could not run without them and they have transformed the way individuals, the city, the economy and society operate. They are part of their DNA. Using creativity, culture, the arts and creative industries in city development should not happen formulaically. It is more an art than a science, but strong principles can help cities on their own terms. These include going with the grain of local culture rather than against it, focusing on the distinctiveness of place and involving citizens in an act of co-creation in making and shaping their evolving city. The logic of arts and culture can be diametrically opposed to economic rationalism and this can create many dilemmas. One role of creativity is to find bridges between their complex aims and goals. Secondary cities need to work even harder on their cultural offer and major events and accolades such as the European Capital of Culture can be catalytic in increasing internal self-confidence and external resonance. The best cities are ultimately experienced as living works of art.
Covering a 25 year perspective this essay is based on a qualitative investigation of the strengthening relationship between the arts more narrowly defined and the broader culture of a city, creativity in all its guises and city development. Commissioned by the European Capital of Culture 2010 in the Ruhr in order to generate sustainable development strategies for the region beyond the year 2010 as well as to inspire other cities in Europe facing similar challenges and dilemmas.

Its brief sweep through history and the trajectory of development seeks to anchor today’s perspectives and insights within a longer term view. Whilst this essay highlights six cities – Bilbao, Bologna, Krakow, Lille, Liverpool and the Ruhr – it must be remembered that the creativity/culture nexus is a world-wide phenomenon with interesting and proliferating examples across the globe.

The central hypothesis is: Widespread creativity, applying a cultural perspective to urban development as well as using art disciplines and their commercial manifestations drives deeper transformation in cities. These contribute not just to adding economic value and jobs, but more importantly, to the evolutionary process by which individuals, the city, society and the economic system grows as a whole. They are thus even more important than we have previously considered. The creativity/culture nexus, therefore, may have as much impact as did the discovery of electricity which has transformed the way we live. The contention here is that their combined impact is immense, insufficiently understood and under acknowledged. Indeed they are like electricity or a nervous system. Our lives, our cities and their economies could not work without culture and creativity. They are constantly changing places and how we live in them.

This triad of words, ‘culture’, ‘creativity’ and ‘the city’ and the deeper concepts underlying them are now constantly used in unison. Seen together they exert a powerful force that is inextricably interwoven. They create an unfolding dynamic with far-reaching impacts on urban life, its wealth creation prospects, well-being, the overall vibrancy and vitality and with far-reaching impacts on urban life, its wealth creation and political agenda. These arguments are added up to show the greater overall impact of culture and creativity on social cohesion or economic welfare. This adds to the confusion. It means people can often talk past each other. Yet interestingly this ambiguity and paradox can enrich discussion by forcing us to reflect. Much of what follows is commonly known, but usually it is not viewed and considered together.

A final section briefly summarises lessons learnt and highlights the strategic dilemmas and conflicts that cities face in bringing culture and creativity together with economics and commerce in urban development.

There is global recognition that ‘creativity’ whose essence is a multifaceted resourcefulness is a primary asset since human cleverness, desires, motivations and imagination are replacing market access as urban resources. The creativity, skills and talents of those who live in and run cities will determine future success. Of course this has always been critical to cities’ ability to survive and adapt. Creativity is both generic, a way of thinking and a mindset and it is task oriented in relation to particular fields, such as inventing novel applications of sound technologies for safety in mining or developing learning tools with interactive media. Creativity requires certain qualities of mind, dispositions and attitudes, including curiosity, openness and a questioning attitude. It involves fluency and flexibility and the ability to draw on ideas from across disciplines and fields of inquiry, to think laterally and blend concepts from seemingly unrelated domains. It is based on divergent thinking, which opens out possibilities, reveals patterns and helps find solutions before prematurely closing in on a specific answer. This means that the organisational culture of a city needs to foster a culture of creativity which by being embedded helps a city to rethink itself when necessary and to adapt to changing circumstances.

Creativity is legitimised within the arts in particular, as well as areas of scientific research. Therefore there is much to learn from these fields. The applications of creativity are very strong in arts related fields and their industrial and service driven manifestations from design to music or well as areas of scientific research. Therefore there is much to learn from these fields. The applications of creativity are very strong in arts related fields and their industrial and service driven manifestations from design to music or...
Many cities call themselves ‘the creative city’, at my last count over 50. By this they usually mean that they have a strong arts sector and cultural innovations. They include Vancouver, Toronto, Auckland, Kanazawa, Manchester or Barcelona calling itself ‘the capital of creativity’. Bandung in Indonesia which is ‘the emerging creative city’ or UNESCO’s ‘creative cities’ network with places like Bologna, Montreal and Ghent and 26 others designated as creative for specific fields. The Ruhr has its ‘creative quarters initiative’. Liverpool has not used the brand, but for over 30 years has promoted itself as ‘creative’, whereas Krakow labels itself as ‘cultural Krakow’. Lille has not used the concept officially, but it is increasingly used in public documents. Importantly, Bilbao, by contrast, has addressed the issue differently. The city has been aware that it is innovative in that it has been bold in its urban renewal processes and that its economy has been entrepreneurial in taking on existing inventions and applied these in various areas of advanced manufacturing such as automotive components or wind turbine technology. It has been concerned, however, that it is not creative enough in that it has not invented new products, processes or services whose copyrights could accrue to the city. It therefore commissioned in 2009 from Comedia a generally applicable Creative City Index to measure and monitor its creative pulse.

The creativity agenda has two trajectories. The first stemmed from the concern that the arts were under threat and becoming post-industrial. Slowly and with gathering force from the 1960’s onwards it became clear that Western societies were changing profoundly. It was the talent the new economy increasingly needed. The raw materials of this new knowledge intensive system were increasingly information, knowledge and creativity. Knowledge here is both, a product in itself and also a tool to enhance the value of other activities through the judgement and analysis by which it adds value to any idea, product or service. To have knowledge entails having a variety of subject and technical expertise and the intellectual capacity to problem-solve and discover opportunities. The latter is of course concerned with being creative. Knowledge is essentially human capital. It accentuates too the different types of skills and workers needed to run a society. In a more knowledge intensive economy, the specialised labour force was initially seen as largely maths and computer literate and data savvy. This it felt was not enough. The key point was the realisation that the pre-condition for knowledge and ultimately the capacity to innovate was the ability to be imaginative and creative. This was the talent the new economy increasingly needed.

Knowledge, crucially, can grow rather than deplete by being shared and applied. This shifts the economy from one of scarcity to potential abundance. Here, the new forces unleashed by the internet and especially the interactive and immersive Web 2.0 processes came into their own.

The possibilities of open source innovation and co-creation meshed the IT driven economy with that of new social media activism associated with the creative economy. Together they have challenged the predominant business models.

At the same time cities began to compete more intensely with each other from the late 1980’s onwards as they recognised that city regions were the source of wealth generation for countries. This created a focus on the human resources needed to make the city competitive. Steve Hankin from McKinsey coined the term ‘war for talent’ in 1997, which is a short hand for the skill, expertise and human potential a city needs to compete. Here people began to ask what are the physical, social and cultural conditions needed to keep and attract skilled people, especially those with strong reputations who have choices where and with whom they wish to work. They are the primary resource an organisation has. This group prefers classy, interesting, experientially rich environments, which was pointed out by Richard Florida in his ‘The Rise of the Creative Class’. This dynamic first affected the top global cities like New York, London, Singapore, Hong Kong, Paris, Madrid, Sydney, Tokyo, Hong Kong or Shanghai, which compete most intensely. This reinforced the alignment between the knowledge and creativity agendas.

The urban creativity agenda then rapidly moved down the urban scale as every city needs skill, expertise and talent. Starting two decades ago with the 25 largest global cities now second and third level cities are equally focusing on the agenda, such as Ghent, Umea, Oulu in Europe. This coincided with greater networking capacity enabled by the internet and its innovations. Since so many transactions can happen virtually time and space flattens and you can be here and there, anywhere and anytime. This more seamless connectivity poses challenges for all cities and is an opportunity for smaller cities as with their intimacy, quality of life and scale they can now compete with larger cities.

The main lesson is that creativity is an all pervasive attribute as important to urban development as IT connectivity. In order to move onto this new terrain we need to shift the old ‘urban engineering paradigm’ to city development, which is largely hardware focused and which focuses more on the idea of the ‘city as a collection of projects’ to the notion of ‘creative city making’ which sees ‘the city as the project’ and which integrates hardware and software thinking and initiatives. The latter focuses on which physical conditions can foster and create relationships, networks and bonding between and within groups. It pays attention to how a place feels and its atmospherics. Equally it assesses how cities can develop stories for themselves that generate recognition, resonance and impact.

The latter focuses on which physical conditions can foster and create relationships, networks and bonding between and within groups. It pays attention to how a place feels and its atmospherics. Equally it assesses how cities can develop stories for themselves that generate recognition, resonance and impact.
The city has always been a centre of transactions, power and intellectual resources. Yet it is now hard to imagine that in the 1970’s there was a fear that the city was in such a decline, that it might not recover as their city centres hollowed out with businesses leaving and the flight to the suburbs. The result was urban wastelands as industry declined and began to move to the Far East. Remember New York barely avoided bankruptcy in 1975.

A significant phenomenon emerged in the transition to knowledge intensity from the early 1980’s onwards. The city was ‘rediscovered’ and began again to exert a gravitational pull, because of its resources in learning, its capacity to help exchange and transactions, its cultural institutions and richer artistic life and vibrancy, its stock of buildings and infrastructure and its transport links. The city was seen as an accelerator of possibilities. The city is a dense communications system that is not easy to replicate in other settings. Once the urban focus re-emerged a vast urban regeneration process began with the tearing down of the past to make the city ready for professional services related industries, offices and offices. Simultaneously an extensive retrofitting exercise began. World-wide several hundred old warehouses, breweries, train, bus or fire stations; cement, coal, textile or steel factories; old markets or military barracks or older working class districts were transformed into culture or experience centres, incubators and company breeding grounds. As the celebrated Jane Jacobs noted: ‘New ideas need old buildings’.

City planners and property developers then self-consciously tried to create developments which tried to mimic and recreate the urbanity and qualities of well-functioning cities with their mixed uses and intense interactions. The industrial period had fostered segmented land use planning in order to separate dirty or less healthy functions from living and recreation. In the cleaner knowledge economy this separation is less necessary and mixed uses and new configurations for living and working have emerged.

Why do these structures resonate? They exude memory and the patina of ages in an age where novelty erases memory increasingly and of course, physically their spaces are large and allow for flexibility and interesting structures. As the celebrated Jane Jacobs noted: ‘New ideas need old buildings’.

They include most famously those in the Ruhr such as Zeche Zollverein in Essen or Duisburg Landschafts Park; the Tate North and waterfront development in Liverpool; the Rouse Piscine or Tourcoing textile mills in Lille Metropole; the Manifattura delle Arte district in Bologna, the Alhondiga in Bilbao; the revitalisation of Kazimierz in Krakow and especially its Jewish Quarter. There are too the Distillery District in Toronto, the Cable Factory in Helsinki, Galeries De Schaerbeek in Brussels, the Custard Factory in Birmingham, the refurbishment of old industrial buildings in Pyrmont Ultimo in Sydney, Metelkova Ljubljana, the Truman Brewery area around Brick Lane in London and many, many more. The renewal of these large buildings often led to the wider regeneration of whole districts.

A focus on suburban creativity and culture will be one of the major priorities in the next phase of urban development. Cities are becoming more difficult to negotiate. At the same time the the increasing possibilities to telecommute and connect virtually, as well as environmental concerns, have led policy makers to consider how to give suburbs a greater sense of place and urbanity. Cultural programming will play an important part in this process.
Culture at its most abstract is how a society or place expresses importance and meaning. The residues of what collectively matters to a place and its people we call the culture of a place. It determines its character and personality. This depends on context from its topography to its personal histories. This is why mountain people usually differ from people growing up in a port city like Liverpool or those from an industrial city like Lille or Bilbao from a city based on learning like Krakow and Bologna. The one may be more inward looking and the other the reverse. Culture is not static, but transforms over time, although a past can give strength and anchorage. That past is both sedimented in the mind and the physical fabric of the city.

What is deemed important is inscribed and embedded in codes, rituals, attitudes and behaviours. It becomes the tradition or the heritage, such as the intellectual traditions of Krakow that some say can make it more conservative. By contrast the fierce competition between Liverpool and Everton football teams or Schakke and Dortmund in the Ruhr stems from their culture of solidarity and also tribalism. What these cultural values are or could be is often challenged and needs to be continually renegotiated. This process is in itself a creative one, but fraught with difficulties. Tradition usually confronts the new and younger and older perspectives can clash. Significantly today there is also an historic break brought about by the internet revolution where digital novices can clash. Significantly today there is also an historic break brought about by the internet revolution where digital novices can clash. This is not a matter of nostalgia and reinventing the past, but fostering identity and working with it to move forward. This was an important insight the Ruhr area had in moving forward. It is also why it undertook projects like ‘New Pott: 100Lights/100Faces’ highlighting the stories of families from 100 different nations.

Urban reinvention is not only about physical change and creating new economic sectors, it is in essence a cultural project as you have to bring the population with you and engage them in your renewal story. This means operating at many levels simultaneously. It starts obviously with acknowledging a crisis and the need for dramatic change and this is often painful. The next step is to bring the forces, public, private and community based, together. Then a vision needs to be in place that has enough compelling elements in it to drive forward momentum. For Krakow one strand was regaining a place on the European map; for the Ruhr a strand was turning the weakness of environmental degradation into prospects for new knowledge intensive industries; for Lille moving from the geographical periphery more to the centre. For all the former industrial cities there has been the educational problem. All the six we focus on have a bedrock of the poor who do not have the background, different from one that requires individual initiative and new knowledge intensive industries; for Lille moving from the geographical periphery more to the centre.

These transition processes cause dilemmas for each city and it demands a balancing act between the old and the new. Some brief comments on those cities to whom we give special mention. All cities are proud, but some cities can be too proud, which can cause them to be inward looking and defensive.

Bilbao has had a several century old battle to assert its identity vis-à-vis Spain and thus festivals like Asta Nagusia, ‘the big week’, have special significance. In this light the creation of the Gehry built Guggenheim Museum is extraordinary. Its creation involved much scepticism because in the city’s economic crisis at that time there was investment in a cultural institution, rather than traditional job creation and secondly because some said the museum was catapaulted in from the outside. Yet it is one of the few initiatives of its kind that has worked and has changed the perception of the city highlighting its verve and style that was always there, but is now seen in a new light. The Bilbao effect is difficult to replicate. Remember too that the museum was only one project of many and to identify one theme in Bilbao from which other cities can learn it is the quality of its physical regeneration from the arrival at the airport, to its metro stations to roads and overall place making. This renewal is now stretching out to Abandoibarra and Zorrouraure. Bilbao encapsulated its approach by stating; ‘You have a once in a lifetime opportunity to renew the civic infrastructure, at a minimum it should be international class and as a norm world class’. As a consequence many of world’s architectural glitzy have built or are building in Bilbao from which other cities can learn it is the quality of its physical regeneration from 1987 onwards. Bilbao is now a hub for French e-commerce and the logistics industry. It is France’s fourth largest metropolis, but has been seen as dowdy, dirty and somewhat dull. The most dramatic change for the city was the transformation of its centrality through the Channel Tunnel, Eurostar and Eurallie in 1994. From being at the edge, way up North, it is a centre now between Paris, London and Brussels. This remains a strategic perspective for the city and may take a decade or two for the metropolis to reach its potential as a location for higher value services rather than being merely seen as a well-connected logistical hub. This makes projects like the Centre of Excellence for E-Commerce and the Pôle Régional Numérique or Euratechnologies important. The latter located in the vast and impressive Le Béar-Lafont building some way off the centre of the city serves as a modern technologies hub for cutting edge activities. There is too the cluster of activities around the University Textile and fashion district including the Bernard Tschumi designed Le Fresnoy, which is both a multi-media exhibition and events centre as well as an advanced cross-disciplinary school for sound, imagery and contemporary art. The same area houses a variety of incubators for new media technologies and the Pôle Images. The area has attracted the hugely successful Ankama company, based in an old mill. It has over 400 employees, many of whom are from Asia and North Africa, and which invests in the development of new media. Important massive multiplayer online role playing games such as Dofus or Wakfu as well as the Mukafukaz comic series.

In order to address the overall problem of entrepreneurship, a constant dilemma for former industrial cities, Creolativité, a public private partnership, was established in 2000 in order to ‘transform Nord-Pas de Calais into a veritable land of creativity’. In addition Lille hosts one of the most important entrepreneur fairs: the Salon Créer.

Lille Metropole like many cities, which faced the decline of their coal mining and textile industries from the 1960’s onwards, had to reinvent itself through services from the 1980s onwards. Lille is now a hub for French e-commerce and the logistics industry. It is France’s fourth largest metropolis, but has been seen as dowdy, dirty and somewhat dull. The most dramatic change for the city was the transformation of its centrality through the Channel Tunnel, Eurostar and Eurallie in 1994. From being at the edge, way up North, it is a centre now between Paris, London and Brussels. This remains a strategic perspective for the city and may take a decade or two for the metropolis to reach its potential as a location for higher value services rather than being merely seen as a well-connected logistical hub. This makes projects like the Centre of Excellence for E-Commerce and the Pôle Régional Numérique or Euratechnologies important. The latter located in the vast and impressive Le Béar-Lafont building some way off the centre of the city serves as a modern technologies hub for cutting edge activities. There is too the cluster of activities around the University Textile and fashion district including the Bernard Tschumi designed Le Fresnoy, which is both a multi-media exhibition and events centre as well as an advanced cross-disciplinary school for sound, imagery and contemporary art. The same area houses a variety of incubators for new media technologies and the Pôle Images. The area has attracted the hugely successful Ankama company, based in an old mill. It has over 400 employees, many of whom are from Asia and North Africa, and which invests in the development of new media. Important massive multiplayer online role playing games such as Dofus or Wakfu as well as the Mukafukaz comic series.

Recent physical transformations exemplified by the Liverpool one shopping complex, the new hotels often housed within the old fabric or the new Liverpool Museum is reinforcing this momentum. It is back on the map for positive reasons. Yet amongst the array of creative cultural initiatives in the city it is perhaps its cultural community development within disadvantaged communities that deserves special mention. These are often unseen and less known, but crucial in terms of how the citizens of a city can feel more empowered and valued. Liverpool cannot reach its former strengths and the rise of Manchester nearby is also a factor, but without its cultural assets it would be far worse off. Clearly the city is attempting to diversify its economy towards the repertoire of bi-sciences, other knowledge intensive sectors and university learning with some success, but it is fighting an uphill battle.

Liverpool, another city of immense cultural richness and powerful architecture, known once as the ‘second city of Empire’ is equally proud. This has been reinforced throughout its decline starting from the early 1960’s onwards, since when its population nearly halved to 400,000. In its search for a new role and purpose the city has remained central within which the Beatles phenomenon was helpful just when the city was suffering most. Yet increasingly there is a sense that the Beatles are only one aspect of its armory like its immense pride in football. The city’s economic vigour has inevitably suffered causing untold challenges as the world turns Eastwards with its port facing Westwards, which is a similar problem to Bilbao. Yet after many years as being seen as a problem its city was on the turn. Urban tourism is key and the main impact of European Capital of Culture status in 2008 was increased internal self-confidence, the changed perceptions of the city and its image with national decision makers in Britain as well as potential visitors. This has shifted its prospects. It is Liverpool’s cultural scene that is the attractor. This ranges from the historical architecture, where many of the superb old banking, insurance and civic buildings have been turned into entertainment palaces to its festivals. It includes the city’s museums, but also its nightlife. For good or bad Liverpool is the North West’s weekend fun city.

The Ruhr is an emblematic region and once the coal and steel centre of Europe, A vast area scarred by over a century of industrial exploitation the regeneration of the Ruhr and within it especially the Emshér Park area over 30 years has been a complex integrated environmental, economic, social and cultural project. Sustainability is seen as having four pillars. Inevitably the residue of history remains in the physical fabric and the mindset of some. Its regeneration process is a very creative long term initiative even if some can find fault with the details. A series of steeping stones, pacing devices and staging posts framed the process to build momentum and celebrate interim achievements. First, the BIA experiment...
within the Emscher area between 1990 and 2000, then the development of the Route of Industrial Culture, culminating with Essen’s European Capital of Culture status in 2010 which it shared with the whole region. The pressure of target dates and deadlines have been useful to drive results. An overarching theme has been to give value to industrial culture. Industrial detritus became industrial monuments and carriers of culture thus avoiding the erasure of peoples’ memory. Industrial landmarks became sources of civic pride. Combined with this was the notion, at times, of using the area as an urban R&D zone and more recently establishing creative quarters across the region sometimes based on older industrial sites and at times on clusters as that for the games industry in Muelheim. Equally more socially oriented projects like Urbanatix are trying to give unemployed young people new chances by providing a platform for them to celebrate their street culture. There are a number of elements worth recalling, which form part of the overall impact and legacy. First, there was a boldness of vision to see the Emscher area and Ruhr in its totality within a long term 30 year perspective such as ‘renaturing’ the Emscher river. The idea of turning weakness into strength was a key concept by turning environmental degradation problems into an opportunity to explore new products. This did not happen on a blank sheet. The setting up of universities in the 1980’s and the skills and expertise they generated provided a significant pre-condition for regional growth. Counter-intuitively stringent environmental standards drove economic development by forcing companies to come up with solutions. This has in part helped develop an export industry for environmental technologies.

Embedding an ethos of innovation from the technological to the social and to link environmental improvement to economic development and now with a focus on the creative industries has been important. Equally to take on board the broader notion of sustainability including the cultural was significant. An added element was to rethink the international building exhibition (IBA) idea by understanding the power of symbols and their deflect use. This included creating industrial monuments and finding new cultural uses for them such as with Zeche Zollverein or the Bochumer Jahrhunderthalle. This continues today with the recent opening of the Dortmunder-U. The unconventional coupling and unusual mix jolt the imagination and surprises and are part of the Ruhr re-imagination package. For instance, they mixed the iconic and the everyday, or the idea of reframing the industrial sites as parks, or the combination of slag heaps and public art or coal mines turned within modern design centres. The notion of using quality as a carrot and economic development as a driver when giving the IBA imprint only to the best examples was significant as was its ‘incrementalism with perspective’ approach. That ethos continues as does the operating philosophy to integrate all regeneration dimensions and to generate solutions that cut across existing boundaries in terms of disciplines, departments or sectors. Yet that challenge remains difficult still today as does the constant need to find mechanisms to bind the 53 towns and cities that make up Ruhr together into a common platform. This was achieved by making each place, besides Essen, a capital for a week. The most emblematic instance of this bringing together was in July 2010 where sixty kilometres of motorway were shut for a day and where around 2million citizens of the Ruhr celebrated their unity as one.

Bologna is a different case as the city of the world's first university. It nicknames 'the learned one', 'the fat one', given its reputation for gastronomy and ‘the red one’, first referring to the colour of its roofs and then to its largely left of centre governments post World War II gives a sense of the place. Bologna has been a knowledge hub for centuries anchored in numerous research centres and with 87000 students comprising 25% of the population this shapes the city’s personality. As one of the centres of the Third Italy it pre-figured many of the forms of network structures and flexible specialisation in its advanced manufacturing sector, food industries, footwear, textiles and electronics that the rest of the world now seeks to imitate. Bologna in that sense is one of Europe’s most creative places. The city has one of the lowest rates of unemployment and one of the highest per capita incomes in Europe. It has been renowned through time as one of Italy’s more dynamic and well run places. There is the strong, well-documented, social economy and active citizen participation which help manage and deliver social, health and educational services. Clearly a deeply cultural city, it does not have ‘the icon’ a globally recognised object, although its ‘Two Towers’ are pretty spectacular. Instead perhaps the city is itself a living work of art. Bologna has traditionally been far more known for its business acumen and as a consequence it has had business rather than cultural tourists. In some sense it did not need to play ‘the cultural card’, since it already had a strong allure and vibrant cultural life partly reinforced by its student population as well as its renowned food culture that stemmed from its historic role of transforming agricultural goods and animal products. Its cultural policy focus has traditionally been more focused on production rather than consumption through spectaculars and events. This has been an internal battle for a while. Its farsighted ‘bottega di transizione’ initiative developed in the early 1980's sought to develop old craft skills and to apply these to new contexts and needs and to merge them with new technologies. This programme gave prizes, grants and other support thus feeding niche advanced craft making and manufacturing. Its status as European Capital of Culture in 2000, however, played an important role in renewing and developing the cultural infrastructure and spaces such as the Sala Borsa or the Manifattura delle Arti district. In turn by raising profile culturally driven tourism has risen. It became in 2000 one of the first UNESCO’s ‘creative cities’ for its contribution to music, although many felt a better designation would have been its contribution to gastronomy. The recently elected council is in the process of agreeing a strategic plan with all major city stakeholders with the promise by the new mayor that culture will be at the centre of the vision for Bologna’s future. This means the city can restart the work which had begun in the early ‘90s and which had led to Bologna European Capital of Culture 2000, and then was virtually abandoned during the last decade. A central theme is to support creative enterprises. More recently these initiatives have been pulled together through ‘Incredibol’ (Industrie Creative Bologna), the creative innovation programme of the city, which launched in 2010. Incredibol is a public-private-third sector partnership committed to ‘adopting’ the best local creative enterprises by offering them premises, finance, advice, consultancy and work opportunities. Another project in planning is the creation of a regional agency to promote and sell the work of the region’s artists. The agency could be called ‘Propheta in patria’, based on a similar project from 1990. One lesson perhaps from Bologna is that when you are already relatively successful there is at times less drive to push your cultural profile so vigorously.

Bologna has been a knowledge hub for centuries anchored in numerous research centres and with 87000 students comprising 25% of the population this shapes the city’s personality.
Krakow has always seen itself as the natural cultural capital of Poland and as one of its oldest cities it has experienced various highpoints including its Golden Age in the 15th and 16th centuries. This immense pride in its history, its ancient university, the Jagiellonian, and its associated intellectual life and its international outlook anchors the city’s self-identity. As a result it has an extensive infrastructure of museums, cultural associations and festivals and is now a natural gathering place for discussing issues in culture, especially in the East. After the fall of communism the city immediately catapulted itself into European consciousness as one of the gems to be rediscovered. It, for instance, set up the prestigious International Cultural Centre in 1990, whose aim has been to facilitate the intercourse between peoples of different cultures and whose main field has unsurprisingly been the cultural heritage of Central Europe. It was the first Eastern European city to gain cultural recognition from the EU in 1992 when it started its special European Cultural Month linked to Madrid’s candidacy. In preparation for that process an economic assessment of Krakow’s cultural themes to be a place of ideas exchange and cultural understanding. The first Jewish Festival started in 1991, in Kazimierz where the Jewish community once lived. It culminates in a huge open air concert on Szeroka Street (Widok Street). Kazimierz, recently crumbling, itself is now becoming one the city’s most creative, bohemian quarters.

There has often been a debate in the city about whether it tends towards cultural conservatism. One important legacy project from the year 2010 was the Krakow Festival Office, which still thrives today. The first goal of the original Festival Office was the organisation of prestigious events and it has taken this learning forward and is the only organisation of its type in Poland. The office takes the conservatism issue head-on and tries break with the stereotype of ‘conservative Krakow’. It promotes cultural events in a contemporary way through the extensive use of social media or interactive games. Indeed already in communist times, for instance, the cabaret Piwnica Pod Baranami was provocative and courageous and there are now new initiatives of this kind. Krakow print making culture was also historically very innovative and challenging and the International Print Triennial in the city keeps the tradition alive. In seeking to surprise Krakow has some unusual facilities such as the interestingly soulless Bunker of Arts or the Manggha Center of Japanese Art and Technology initially funded by the filmmaker Andrzej Wajda’s Kyoto Prize money. A further significant development has been the creation of MOCAt, the Museum of Contemporary Arts in Krakow, which opened in 2011 and is Poland’s first purpose-built modern art museum. It is symbolically located on the site of Oskar Schindler’s former factory in Zablocie, a post-industrialist area of Krakow. As a consequence of this cultural richness Krakow has not as yet developed a strong creative industries development strategy.

Nova Huta, a new town built next to Krakow must be mentioned as part of Krakow’s cultural landscape. The reasons for building such a vastly polluting industrial town, with the biggest steel, cement and tobacco factories in Poland from the 1950’s onwards were mostly ideological and a kind of punishment for the cultural and intellectual Krakow. Coal had to be transported from Święcia and iron ore from the Soviet Union and the products were shipped to other parts of Poland since local demand was relatively small. This did not make economic sense. Of course, Krakow whose population has 25% of students was always at its core a potential knowledge city, which could build on its humanities and natural sciences. Unsurprisingly this is now a priority. For instance, the Jagiellonian Centre of Innovation set up in 2003 is both a technology transfer and innovation incubator centre supporting commercial research in fields like biotechnology, biophysics, physics and environmental protection. Krakow’s historic physical setting, its accessibility and walkability is key in understanding Krakow’s cultural position. Centred around the Renaissance Grand Square (Rynek Glowny) the largest plaza of medieval Europe with the Sukiennice (the Cloth Hall) at its heart it is precisely the kind of environment urban designers are trying to retrofit. It makes being convivial and networking easy.

Krakow, as its leaders say, is ‘one of the most powerful brands in Poland’ and it is culturally based. Krakow sees itself as part of a cultural club as some of its twinning arrangements show, such as, Florence, Cambridge/Mass, Edinburgh and St. Petersburg. A lesson from Krakow is that tried retrofitting. It makes being convivial and networking easy.

Krakow sees itself as part of a cultural club as some of its twinning arrangements show, such as, Florence, Cambridge/Mass, Edinburgh and St. Petersburg. A lesson from Krakow is that tried retrofitting. It makes being convivial and networking easy.
The physical alone, crucially, is not enough to create the vibrant city. The city is more than spectacular architecture, that too often feels lifeless at street level and with which it is difficult to engage. The cultural institutions are often relatively inaccessible, open when most people are at work, or with theatres only open when there is a show. Growing programmes exist to deal with this like museum evenings or nights of the arts initiatives.

This reveals too the container versus contents dilemma. A vast proportion of the budget, especially in the cultural sphere, is spent on building containers and their maintenance leaving insufficient resources for creation and invention – the contents.

Increasingly recognised it has shifted the focus on how you establish a creative milieu. This involves a more fine grained approach to place making and activation beyond a focus on publicly funded institutions. Their style of operation can appear to be more formal, top down, less flexible and representational and suspicious of independents or more commercial approaches to cultural development. By contrast, the pop-up revolution is leading a trend that makes cities more like art installations with ever changing short term venues emerging often in unusual places or retail spaces that are temporarily out of use. They might be galleries, locations for parties or performances. These provide low cost entry points for new creators to make their mark.

Vibrancy comes from a creative cultural ecology, which mixes the commercial and non-commercial, the high class and the popular, the established and the new or the superbly designed and the grotty, that which happens in the centre or that happens off-centre. The description of New York’s theatre scene as Broadway, off-Broadway and off-off Broadway encapsulates the argument.

Part of the repertoire is now establishing ‘creative quarters’ or clusters. Often these merely describe any collection of cultural institutions or museums. These are not per se places for creation, but consuming. More importantly production based quarters, such as with the Ruhr strategy, are usually based on supporting the cultural or creative industries, of music, design, the audio visual and new media. These usually cluster in off-centre locations and over time make these areas formal as cultural quarters in the own right as they spin-off independents. None of the six cities looked at more closely provided model to planning for the unknown in an enabling and facilitating mode. The older model has precise targets, people have well-defined tasks, processes and procedures are rigorously set out, job definitions were circumscribed and room to manoeuvre was limited, in structures that are centrally organised and hierarchical. Instructions come from the top and cascade down. By contrast more participatory processes are called for and cross sector, horizontal working is increasingly important to break out of mono-dimensional urban strategies. Key here is developing the platforms for dialogue to bring ideas into reality. To achieve this requires usually a more participatory process.

The overall aim is to establish a creative ecology which addresses any problem and is a problem every city faces. Today changes are happening so fast we can never catch up with little time to absorb, understand and reflect then to act with some sense of clarity and judgement. Today we are living through a paradigm shift. Certainties evaporate, old ways of doing things are challenged. Periods of history involving mass transformation, like the Industrial Revolution or the internet driven revolution of the past fifty years, can produce confusion; a sense of liberation combined with a feeling of being swept along by events. Normally it takes a while for new ethical stances to take root or to establish a new and coherent world view. Today changes are happening so fast we can never catch up with little time to absorb, understand and reflect then to act with some sense of clarity and judgement. Old ways of doing things are challenged.

The best cultural policies combine a focus on enlightenment, empowerment, entertainment, employability so creating an economic impact.

What we can learn from the six cities explored in more detail is that they understand the complexity of city making in this new era. This needs to focus not only on buildings but also on developing better qualified people who can create contents and value added services both in the cultural, industrial and knowledge intensive sphere. They understand too that we are moving from planning the known in a predict-and-provide mode cultural areas to an open and facilitating mode. The older model has precise targets, people have well-defined tasks, processes and procedures are rigorously set out, job definitions were circumscribed and room to manoeuvre was limited, in structures that are centrally organised and hierarchical. Instructions come from the top and cascade down. By contrast more participatory processes are called for and cross sector, horizontal working is increasingly important to break out of mono-dimensional urban strategies. Key here is developing the platforms for dialogue to bring the various stakeholders together in an iterative process to turn ideas into reality. To achieve this requires usually a more participatory process.

The city wants to show distinctiveness, yet picks as if from the shelf one of the changing, but similar cast of globally architects that appear everywhere. The physical alone, crucially, is not enough to create the vibrant city. The city is more than spectacular architecture, that too often feels lifeless at street level and with which it is difficult to engage. The cultural institutions are often relatively inaccessible, open when most people are at work, or with theatres only open when there is a show. Growing programmes exist to deal with this like museum evenings or nights of the arts initiatives.

This reveals too the container versus contents dilemma. A vast proportion of the budget, especially in the cultural sphere, is spent on building containers and their maintenance leaving insufficient resources for creation and invention – the contents.
The Experience Economy

We have talked so far about the broader culture of places and there are a series of more recent significant trends that have made the relevance of the creative sector much clearer. There is crisis of identity and meaning. Commerce has recognised that consuming on its own increasingly provides insufficient satisfaction. It has sought to wrap the transaction of buying and selling into a broader experience to give it greater purpose.

The first response is the rise of the sensory driven experiential economy, which initially became a new mantra of strategy and marketing. Later this coalesced with the increased significance given to design within technological innovation as well as the emerging potential of the new media and their immersive possibilities. Popularised initially by Gilmore and Pine’s book ‘The Experience Economy’ it describes the union of everyday consumption, the sensory and spectacle. Creative industries professionals play a central role in providing the ideas, technological innovations and imagination in developing these experiential environments. These can be individual items or a shop. For example, as the marketing proportion of a product’s sale value increases this provides a further platform for creative professionals. Production costs in sectors like fashion, watches, jewellery, prestige design items are often lower than 10%. The aim here too is to make something like a watch embody a lifestyle and a comprehensive experience. Recasting a setting or ambiance will become increasingly significant as retailing has to rethink how it can attract people to stores given the internet. With greater choices and higher expectations marketers are competing for customers’ attention in order to break through the clutter and sensory overload to capture their focus. In this process cities and shops are becoming like artistic installations with constantly changing events and often vast, oversized advertising hoardings, which according to your view, are either scaring or making the urban landscape interesting. Every surface is a target for adverts. The exit gates of metro stations, the hand rails on escalators, the stairs leading up to them.

Grabbing attention is done by creating experiences that are so distinctive that they stand out in a crowded landscape. Organisations are creating their own ‘brandlands’, think of Apple, which are destinations, both real and virtual, that deliver a memorable message by telling a compelling story that reflects magic, wonder and opportunity. Theme-park style technology, special effects, and storytelling techniques are applied to physical projects like the Sephora and Niketown stores, the Lincoln Library, a Volkswagen factory in Dresden, Germany; a cultural centre for the Sami people in Karasjok in Norway. Disney may have started this process through its Adventuriland, Fantasyland, and Tomorrowland, but new organisations are working on corporate brandlands, cultural discoverieslnds, and learninglands wrapping everything up in a cohesive narrative, engaging visuals, and soothing musical scores. Think here especially of the activities of the Prada Foundation or the Punta della Dogana or Palazzo Grassi in Venice which houses the Pinault collection. The link with the arts is fore-fronted with many companies from Intel to Audi involved, since it reads to the outside world as ‘creativity’, ‘cutting edge’ and ‘innovative’. Some, like the design company Idea, are even toying with the idea of theming or rethinking hospitals, since we know you can build hospitals that make people feel worse, thus equally they can be designed to help people feel better.

The city, we can see, is a communications device. It speaks to us through every fibre of its being. The lived urban experience comes from a circular sensory cycle. It is a 360 degree, enveloping, immersive experience, which has emotional and psychological impacts. Yet, with the hype about the experience economy we sense, feel and understand the city through increasingly narrow funnels of perception. Living in an impoverished sensory environment this makes us operate with a shallow register of experience and understanding about what is important for our cities to survive well. At the same time, commerce and media seek to pump up our desires in every more extreme way. We have seen how people can lose the art of appreciating the varied sounds, smells, the texture and quality of materials and the look and feel of the city and its component parts. There is distraction, loss of attention, concentration and focus. Sensory appreciation builds the knowledge upon which our worlds are built. This affects beliefs, choices and our priorities for change.

There is a desire, perhaps even a movement, in many championed by organisations like Audubon to take more control of our sensory environment, rather than being passive consumers or even victims of its current effects. Whether we align commerce or the media to trespass on our sensibilities will be one of the crucial battles in defining how our cities evolve in the future. Yet the urban policy world has insufficiently understood the power and potential of the senses. The contrast between everyday sensing of the city and how policy makers usually describe cities as lifeless is stark. A greater understanding of the importance of environmental psychology is crucial. This focuses on the interplay between people and their surroundings and the degree to which it creates stress or feels restorative.

The 21st century will be a search for meaning and identity, as many have noted. In a primordial sense, meaning is transmitted through stories that tell us who we are and where we are going. Those with artistic training in particular have some of the special qualities to make stories. This highlights their power ful role in the next phase of economic development. There will be arguments, of course, about them being used by commercial forces and corporations.

In summary, the assets, resources and value chain of the city can be:
- Hard, material, tangible or soft, immaterial, intangible.
- Real and visible or symbolic and invisible.
- Countable, quantifiable and calculable or to do with perceptions and images.

In the creative city concept what is considered an asset broadens dramatically. Normally cities thought of as tangible like a transport system, a research institute or icon building, increasingly less definable assets are seen as important. They include: ‘being creative’ or ‘having talent’, the ‘atmosphere’ of a place or ‘eco-awareness’ or other non-material things like ‘urban reputation’, a city’s ‘resonance’. Just as in the past patents were not categorised on a company’s or a city’s balance sheet the same is true for human capital or talent.
is not goal-oriented, nor measurable in easy ways, nor fully explicable rationally, its outcome can be mysterious; it has no quick or easy solutions; it denies instant gratification; it accepts ambiguity, uncertainty and paradox; it recognizes that something beyond the rational exists; it proclaims often that humans have the right to pursue freedom and urges confidence in exercising that right; it inspires others to be brave and to risk failure; it champions originality and authenticity but opposes vanity; it accepts the potential for epiphany and exaltation and for having fun and delight; it generates openness to new ideas and new ways of doing; it lives in the “now” – it takes place in the moment; it is transgressive and disruptive of the existing; it is often uncomfortable, even frightening. It is very different from the economically driven mind, which is threatens and challenges. Of course, the arts too are simply entertainment, pleasure and fun and this is equally important.

Yet the arts strong connection with creativity entices the world of economics as their talent can be a source of invention and applied innovation. Historically the link between artists pushing the boundaries and industrial innovation was strong. With the web, social media and cross-convergence in evidence this is becoming true again. Participating in the arts uses the imaginary realm and lateral thinking to a degree that other disciplines do not such as sports or most of science. Those are more rule bound and precise. The distinction between involvement in arts and writing a computer programme, engineering or sports is that the latter are ends in themselves, they usually do not change the way you perceive things; they tend to teach you something specific. The arts often focus on reflection and original thought and they pose challenges. If the goal of cities is to have self-motivated, creative places they need engaged individuals who think. Turning imagination into reality or something tangible is a creative act, so the arts more than most activities are concerned with creativity, invention and innovation. Reinventing a city or nursing it through transition is a creative act so an engagement with or through the arts helps.

Engagement with arts combines stretching oneself and focusing, feeling the senses, expressing emotion or helping to self-reflect. The result can be: to broaden horizons, to convey meaning, with immediacy and/or depth, to communicate iconically so you grasp things in one without needing to understand step by step, to help nurture memory, to symbolise complex ideas and emotions, to see the previously unseen, to learn, to uplift, to encapsulate previously scattered thoughts, to anchor identity and to bond people to their community or by contrast to stun, to shock by depicting terrible images for social, moral, or thought-provoking reasons, to criticise or to create joy, to entertain, to be beautiful. The arts can even soothe the soul and promote popular morale. More broadly expression through the arts is a way of passing ideas and concepts on to later workers could all benefit from seeing their worlds through the arsenal of methodologies of artists. All this has left out that planning, engineering, social services or to the business community especially if allied to other emphases like a focus on local distinctiveness. The positive aspects of the arts are thus clearly related to various forms of innovation that can in principle migrate from its non-commercial origins to the commercial field.

The arts help cities in a variety of ways. First with their aesthetic focus they draw attention to quality, and beauty. Second the arts challenge us to ask questions about ourselves as a place or city. Arts programmes can challenge decision makers by undertaking uncomfortable projects that force leaders to debate and take a stand. Arts projects can empower people who have previously not expressed their views, so artists working with communities can in effect help consult people. For example a community play devised with a local group can tell us much more than a typical political process. Third, the environment artists as well as creative industry professionals can make it more open to new ideas and inventiveness, which might have positive economic impacts. Finally arts projects can simply create enjoyment.

So the arts can help create an open-minded culture that is more resilient and adaptable to the changes brought about by political ructions and globalisation. What other activity can better deal with dialogue between cultures, ethnic conflicts, allowing individuals to discover talents, to gain confidence, to become motivated, to change the mindset, to involve themselves in community.

The arts, crucially, provide significant impulses to move from an industrially based to an innovation driven and experientially based economy. This reminds us that value is not only material based but also immaterial. This is especially relevant for new service design, new open innovation processes based on co-creation as well as digital creativity. The lesson learnt is that perhaps it is artistic thinking that is the strongest message from the arts. Planners, engineers, business people, social workers could all benefit from seeing their worlds through the arsenal of methodologies of artists. All this has left out that the best of our past art ends up in museums and so the arts contribute to creating destinations, visitor attractions and help foster a city’s image and identity.
THE CREATIVE ECONOMY

EXPLORING THE NAME

Let us start by being pedantic. What is in a name? We call the sectors music, media, performance, film, literature or design the creative economy. Whilst important these sectors cannot be deemed the totality of creativity in an economy. Other sectors that need scientific inventiveness are also creative and there are creative solutions to the broad realms of engineering or manufacturing processes or techniques. There is imagination applied to services industries that have nothing to do with the sectors defined as the creative economy. This can cause confusion and may in the long run be detrimental since outsiders to the field may not take them seriously.

The sector was not always given this name. Way back in the 1930’s the original work by Theodor Adorno and especially Walter Benjamin (The Work of Art in the Age of Mechanical Reproduction) 1936) had partly seen ‘the culture industry’ as a kind of monster with largely negative connotations that reduced authenticity and through mass production of images became a manipulative force. Once interest revived in the early 1970’s the sector emerged as the role of the cultural industries in transmitting identity, the image of place and perceptions. In the 1970’s a counter movement developed. Many smaller oppositional cultural institutions, companies were founded by state institutions, who created the alternative media movement. This provided in part the soil from within which the interest in the sector emerged. Its later manifestations were far less political and often driven by the lifestyle choices of those starting micro-business based on music, graphics or design.

An important shift was when the British Labour government returned to power in 1997 and its Department of Culture, Media and Sport increasingly saw the cultural industries as creative industries, perhaps trying to avoid is political connotations. It set up a Creative Industries Task Force and an analysis and benchmarking system that has since become a reference and model. Other interesting terms have also been used, such as in Hans Magnus Enzensberger’s book ‘The consciousness Industry’, John Hokwins proffers the term ‘Corypht industries’ in his 2003 book ‘The Creative Economy: how to make money from ideas’. Other options could be ‘the imagination industries,’ the experiential industries’ or even the sensory industries’.

This brief outline merely highlights the difficulties in describing these disparate and in some ways connected sectors in an economic sense. For instance, many parts of the sector have copyrights that are tradable, yet if we include art projects many have no intention of having a marketable value. Of course, some art works are involved in market processes like auctioning. By considering these other definitions as well interesting dimensions and impacts of the sector are revealed.

Whilst the sector’s landscape was still dominated by powerful large scale companies, such as those in Hollywood, as music companies or companies like Bertelsmann, this vibrant sub-sector became very important in revitalising segments, districts and even whole cities.

The rise in importance of the creative industries emerged along a number of trajectories from the late 1980’s onwards. These included: the restructuring of the global economy and the search for new growth sectors as production moved inexorably to the East forcing every city in the West to reassess its sources of wealth creation; the recognition that the entertainment industry was vastly significant well beyond Hollywood and growing; the increasing global importance of marketing and communication and the special role of these sectors from corporate video to graphic design; the understanding that the different sub-sectors were connected and cross fertilising and so were larger than they first appeared. A counter point, for Britain was when music industry exports overtook car exports 30 years ago. In relation to their own organisational mission UNESCO and the Council of Europe were in the vanguard and undertook major research in the early 1980’s in what they called the cultural industries. Their primary purposes were twofold, first to look at employment prospects within less developed regions, but especially to highlight the potential of a sector that embodied distinctiveness in an increasingly homogenising world. Crucially they recognised that music, film, design, literature or performance embed and project the identity and image of places.

Separately, somewhat later from the early 1980’s onwards, two worlds began to mesh, that of arts and cultural policy and the economic. Second, the need to diversify funding including sponsorship rose dramatically. Initially the mutual benefit was based on providing new resources in exchange for enhancing the image of sponsors. Over time the dynamic of these relationships with non-cultural organisations changed. Some were based on unexpected consequences, such as the possibility of artistic organisations to provide services to the commercial sector like theatre groups running leadership or community projects workshops. In addition the corporate social responsibility agenda meant that links were less based on patronage and more on exchange of services. Third, the whole sector blossomed and spread and so what were in essence contract relationships in return for funding, such as providing outreach or educational services. At the same time high unemployment levels meant that initially cities, and later governments like in Britain from 1997 onwards, saw the creative industries and even the subsidised arts areas as sources of employment. As larger industrial combines began to break down the need to develop start-up companies grew and the creative sectors were especially vibrant. This required a major rethink in terms of how enterprises were supported and operated since their criteria historically had been based on assisting larger organisations rather than one to five people organisations. The alignment of interests between the cultural and economic worlds drove the interest in the creative economy in the public policy arena.

In essence cities as diverse as Liverpool, Bilbao, Barcelona, Manchester or Birmingham struggle with industrial restructuring viewing designed the arts and creative industries as a possible answer to a mixed conundrum of problems, such as the need for new jobs, how to anchor identity in a changing world, how to foster social inclusion. Meanwhile more widely within European cities similar developments began to take place although with a time lapse that has now been overcome. Indeed, the recognition of the importance of the sector came late to the European Union with the first comprehensive assessment of the sector in 2001 called ‘Exploitation and Development of the Job Potential in the Cultural Sector in the Age of Digitalisation’. For reference Liverpool undertook its first impact study 1987, the Nordrhein-Westfalen government commissioned its first Kulturwirtschaftsbericht, encompassing also the Ruhr in 1992 and its partners, which it has followed up with updates; Krakow’s smaller study was undertaken in 1992. Bilbao and the Biscay region only undertook its first assessment in 2005. Indeed the important landmark was the UNCTAD creative economy study of 2008 which gave the sector global credibility.

Overriding everything with the rise of the new public management ethos was the need to provide evidence. This came in various forms. Justifications for culture, which essentially for public funders means investment in art forms and cultural organisations, depended on the building reputation and distinctiveness or in encouraging civic engagement, their contribution to adding value to property developments as well as in helping regenerate areas in transition and especially former industrial sites; they did help to increase the perceived quality of life; to foster communication within the city and between cities; their role in fostering innovation and creating the conditions for a creative milieu.

In sum, the arts and cultural sectors are seen as an important economic factor in their own right, they contribute to tax revenues, they help increase property prices; they are a location factor, they help drive the experientially driven economy, they help add value to other economic sectors for instance through design input or ability to help communicate and sell other products and services and of course they create work, encourage SME development and tourism growth.

The notion of value was narrowed down and transformed into economic value with the rise of the ‘economic turn’. Everything including the arts became monetarily quantifiable and increasingly was justified because of its economic impact. For many sceptics this was a form of economic entrapment through which it became less possible to discuss artistic or cultural content in its own terms. They felt there were too many compromises.

Since then several hundred studies of the economic importance or impact of the arts and culture have been undertaken across the world. There are specialist journals of cultural economics and global conferences on the theme practically every week. Over time, the shift from art for art’s sake studies, in the early 1980’s, highlighted the arts impact on life quality and their function as amenity. Increasingly then the role of art as an industry was highlighted and the connection between culture and commerce emphasised. The emphasis was on the arts and cultural content in its own terms. They felt there were too many compromises.

The power of the argument was to link the combined sectors from music, to design, to dance together, which showed that in many cities they represented between 5% and 10% of their local economies. In some central places like New York and London the proportion is even higher.

Later increasingly other arguments were brought into play such as the spin-offs from investment in arts, heritage and cultural institutions. These included their role in establishing identity and their ability to transmit values; their capacity to assist integration and to foster social inclusion: their help in building reputation and distinctiveness or in encouraging civic engagement; their contribution to adding value to property developments as well as in helping regenerate areas in transition and especially former industrial sites; they did help to increase the perceived quality of life; to foster communication within the city and between cities; their role in fostering innovation and creating the conditions for a creative milieu.
GRASPING THE POTENTIAL OF CREATIVITY FOR DEVELOPMENT

Normally discussions about the creative industries have focused on describing arts activities like singing or music making, performing or designing as the music, theatre or design industry. We know they are significant industries in their own right, such as music’s role as an entertainment and performance industry. We know too they add value to other sectors in an obvious communication and marketing sense through graphic design, creating adverts or corporate videos. We know they completely mediate our perception of the world and thus how we experience it. In the long term advocacy processes to establish their importance, their direct and indirect effects have been calculated and their economic worth estimated. This is fine as far as it goes, but it is limiting.

Consider a thought experiment. What lies behind what we call music, the visual arts, design or new media? At its core music is sound and vibration; the painting arts are about visualisation; film about moving images; design is in essence a moulding, patterning and problem solving activity and the new media are largely focused on connections. Of course, each medium has its own history, styles and genres. Yet these core-attributes are vital and an integral part of any activity, product or service. They enhance their value, usability, relevance and resonance.

Take almost at random a study on how Perth could be more creative, which investigated the mining sector or oil and gas industry. A closer examination showed how creative economy sectors are deeply involved. Think of sound and vibration which helps discover oil and gas in deeper sea beds where sound helps create seismic surveys and 3-D interpretations of underwater conditions. Think of visualisation where data streams can be converted through the convergence between computers and graphics to images to help understand what is going on underground by creating virtual worlds so helping decisions on where to mine. Think of film, where in mining you can explore dangerous terrain. Consider the uses of virtual reality simulations to explain safety procedures.

Consider medicine and long distance diagnostics and treatment where telepresence is now possible. This essentially uses cutting edge creative industries related communications technologies, such as high speed data connections or video telephony combined with robotics to allow for remote surgery where the patient can be kilometres away. The broad category of telemedicine or telenursing helps provide health care at a distance through hand-held mobile devices that allow healthcare professionals to view, discuss and assess patients as if they were in the same room. Equally ultrasound devices, using sound to see, can emit high frequency sound waves that help create images or reflect points of differing density so helping the identification of a disease at a distance. Discussions with Merseybio Incubator in Liverpool showed at least 20 applications of visualisation, imaging or sound related applications from magnetic resonance imaging to virtual and augmented reality applications, for instance, for training or for understanding vast data sets.

Consider developments in e-commerce, where Lille is a leader with the presence of companies like Auchan. It also houses France’s e-commerce centre of excellence. To make e-commerce function at its best means creating immersive, interactive experiences, which even allow for fitting on clothes virtually. Essentially buying then becomes a filmic experience that you the user control.

Consider logistics which is also a strength of Lille, where real time tracking requires visualisation as does the monitoring of most production facilities where the film of the process determines the decisions you make.

These merging processes are all pervasive. Consider the sci-art movement, initially largely funded through a long term initiative of the Wellcome Foundation. It tapped into the understanding that the beginning of the 21st century has finally seen a rapprochement between the two great ways of exploration, discovery and knowing: art and science. The concept of the Sci-Art built on this and brought artists and scientists of all kinds together to work in a structured environment on projects of mutual discovery and ultimately benefit. From the beginning, the Sci-Art concept was based on the premise that the most fruitful developments in human thinking frequently take place at those points where different lines of creativity meet.

Over the years the Sci-Art competition brought together over 2000 artists and scientists working in partnership to combine their insights and ways of thinking to solve problems and come up with innovative ideas. Globally there are other initiatives such as ArtSci which was funded by The Rockefeller Foundation. One of the Sci-Art winners was ‘the grass project’ where artists wanted to trap the chlorophyll to stop the grass becoming brown in the gallery. A collaboration with Britain’s leading agricultural research institute followed, but the results were surprising. The chlorophyll problem was not solved, but the scientists had problems in interpreting vast data sets which the artists helped them visualise in new ways.

Seen in this light the activities of the creative economy are all pervasive. It then becomes the platform through which practically any form of innovation is generated and determines how the economy works.
The public and creative commons are both expressions of the same idea – one is physical and the other virtual. The journey or travel and trajectory of many of the developments in the cultural field is towards openness, sharing and inclusiveness. Much of this is driven by the potential of the internet and especially the social media exemplified by Facebook, Twitter, You Tube and well beyond. These developments have fast tracked interaction, exchange and collaborations and whilst they may also lead to information overload and distraction their impacts can be powerful and beneficial as is witnessed by their contribution to the Arab Spring.

Social media are transforming the means of communication affecting the nature of business and indeed are helping establish new business models with dramatic effects. These include: the reshaping of the high street and shopping in general; the ability of companies to operate anywhere and their role as centres for collective experience, identity creation and the neutral territory. At their best, helped by urban design, they are a kind of home from home – a third space.

There is a parallel to the debates around ‘creative commons’, which is an organisation and an idea that ‘develops, supports and stewards the legal and technical infrastructure that maximises digital creativity and its sharing and innovation’. This challenges traditional definitions of copyright and is increasingly used especially by the young. The seamless connectivity it promotes has a parallel in the physical realm. The best environments to foster transaction and exchange and perhaps ultimately new ideas are those where there is ever present Wi-Fi and places where you can work that are neither home nor an office. This might be a lobby, a bar, a café, a transitional covered or open space in the public realm. This requires retrofitting most cities for conviviality and sociability.

The journey or travel and trajectory of many of these cities and then a further 20 or so in the top 50 are created, facilitated and enacted. There are only a handful of niches that a city can become known for, such as with Milan’s global position in design and fashion. For instance, Bilbao is a world model for urban regeneration and has become a must see destination or Lille has strong riches in e-commerce and logistics and the Ruhr’s industrial culture route is unique. Liverpool interestingly combines football and culture. Bologna has a strong and successful enterprise culture and is an intellectual hub as is Krakow.

Now that gifted people increasingly choose the place first before the job within that place secondary cities can compete on a new terrain: that of quality of life. Their relatively smaller size, the ease of transactions and exchange can counteract some of the disadvantages of lack of centrality. Secondary cities benefit especially from special designations like the European City of Culture. It can be vital in changing self-confidence and the external perception of place.

There is a series of balancing acts and strategic dilemmas cities need to consider in using a cultural perspective in development. They include:

• Focusing on production, company formation and economic supports or consumption and spectacular events;
• Emphasising the heritage of the city or its innovations;
• Highlighting art forms or broader themes within which art forms fit;
• Looking at older media or the newer experimental forms;
• Balancing development and programmes on the city centre or the suburbs and outlying areas;
• Encouraging the mainstream institutionalised funded cultural scene or also the alternative, fringe and provocative scenes;
• Being aware of the interconnections between the physical hardware of the city and its software priorities which are the activities people undertake, how they interact and bond;
• Managing cultural activities in an art form department or linking cultural concerns to the remits of all departments;
• Short-term political expectations of visible progress or creating the long-term public conditions for sustainable, self-generating success.

Some find this range of evidence about the importance of creativity, culture, the arts in city development still not convincing. The arguments they say are too soft or vague, and that may at times be true, but not always. The tangible is easier to grasp than the intangible. Yet as Daniel Yankelovich the renowned American pollster noted: ‘The first step is to measure whatever can be easily measured. This is okay as far as it goes. The second step is to disregard that which can’t be measured or give it an arbitrary value. This is artificial and misleading. The third step is to presume what can’t be measured isn’t really important. This is blindness. The fourth step is to say that what can’t be easily measured really doesn’t exist. This is suicide!’

The current financial crisis is putting pressure on all initiatives focusing on creative approaches to city development and the use of culture in urban transformation. There is a paradox. Budgets are shrinking just at the time cities increasingly recognise the importance of creativity and its unpredictable outcomes and the role the creative economy or the arts can play. There is a growing culture of caution and risk aversion.

Cities should look at the nexus of creativity, culture, arts and the creative economy as part of a wider ‘creative ecology’ which includes innovations in other fields such as the incentives and regulations regime or social innovation or other sectors not related to the creativity industries. To get full benefit of their potential, finding new ways of communicating with citizens and audiences is crucial especially on the part of the public interest sector. This blends the use of new social media technology with core ideas such as co-creation or open innovation.

The best cultural policies and their associated programmes, adapting Dorte Skot-Hansen’s ideas combine a focus on:

• Enlightenment, which fosters insight, knowledge, education and reflection. This helps broaden horizons, raise aspirations and understanding of our own and others’ cultures.
• Empowerment, which concerns strengthening identity, focusing on social inclusion, finding ways to strengthen cohesion and joint working and visioning.
• Entertainment is important for its elements of playfulness, leisure, fun and recreation and relaxation.
• Employability captures the ability of the arts and involvement in creative activities to increase competence, confidence, communication skills and overall capabilities, which can migrate and be relevant to working in all sectors.
• Economic impact is one of the major direct and indirect benefits of good cultural policy focus, by highlighting the need to work within economic imperatives, such as job creation, skills enhancement, helping start-ups and fostering an entrepreneurial culture.

This culture and creativity agenda implies that cities cannot work within a silo mentality. It requires new ways of working that are strongly inter-disciplinary and cross-departmental, linking for instance, those concerned with culture, economic development and social welfare.

Primary global cities are magnetic. They are strategic places and hubs which have a direct effect and influence on world affairs economically, culturally and politically, where global agendas are created, facilitated and enacted. There are only very few of these cities and then a further 10 or so in the top league. They can operate strongly across the whole value chain from ideas generation, production, distribution and marketing, and
A CODA

Where do we go from here? We are living through a paradigm shift in how cities need to think of their assets and resources and how they need to manage themselves. To adapt Albert Einstein’s phrase: ‘The thinking that got you to the issues you have to face, will not be the thinking that gets you to where you want to be’. Periods of history involving mass transformation, like the Industrial Revolution or the technological revolution of the past fifty years, can produce confusion; a sense of liberation combined with a feeling of being swept along by events. It thus takes a while for clarity to emerge and to establish a new and coherent world view as well as for new ethical stances to take root. Our six city examples show that cities at every level in Europe are rethinking their role and potential in the 21st century. The watchwords are: ‘Be alert’.

This means understanding and being able to unscramble the mush of trends, fads and fashions. For instance, is co-creation and crowd sourcing a profound trend or merely a fashion? It involves being able to distinguish the deep from the shallow, the superficial from the meaningful, the strategic from the trivial and to understand timelines and connections as well as the differential rates of change and the nature of their impacts. One thing is clear. In order to cope with the unpredictable it is better to have the courage to look at things from a 360 degree perspective where joint insights are combined.

1. The study ‘The economic impact of culture in Cracow’ was undertaken by Charles Landry of Comedia.
